NOTES

- These figures illustrate the rate of change in capacity of a standard indoor unit system at maximum load (with the thermostat set to maximum) under standard conditions. Moreover, under partial load conditions there is only a minor deviation from the rate of change in capacity shown in the above figures.
- Method of calculating A/C (cooling/heating) capacity:
The maximum A/C capacity of the system will be either the total A/C capacity of the indoor units obtained from capacity characteristic table or the maximum A/C capacity of outdoor units as mentioned below, whichever smaller.

Calculating A/C capacity of outdoor units.

- Condition: Indoor unit combination ratio does not exceed 100%.

$$\begin{aligned} \text{Maximum A/C capacity of outdoor units} &= \text{A/C capacity of outdoor units obtained from capacity characteristic table at the 100\% combination} \\ &\times \text{Capacity change rate due to piping length to the farthest indoor unit} \end{aligned}$$

- Condition: Indoor unit combination ratio exceeds 100%.

$$\begin{aligned} \text{Maximum A/C capacity of outdoor units} &= \text{A/C capacity of outdoor units obtained from capacity characteristic table at the combination} \\ &\times \text{Capacity change rate due to piping length to the farthest indoor unit} \end{aligned}$$

- When overall equivalent pipe length is 90m or more, the diameter of the main gas pipes (outdoor unit-branch sections) must be increased.

- Read cooling/heating capacity rate of change in the above figures based on the following equivalent length.

$$\text{Overall equivalent length} = (\text{Equivalent length to main pipe}) \times \text{Correction factor} + (\text{Equivalent length after branching})$$

Choose a correction factor from the following table. [When cooling capacity is calculated: gas pipe size
When heating capacity is calculated: liquid pipe size]

Rate of change (object piping)	Correction factor	
	Standard size	Size increase
Cooling (gas pipe)	1.0	0.5
Heating (liquid pipe)	1.0

In the above case (Cooling) Overall equivalent length = 80m x 0.5 + 40m = 80m

(Heating) Overall equivalent length = 80m x 1.0 + 40m = 120m

The rate of change in cooling capacity when Hp = 0m is thus approximately 0.78
heating capacity when Hp = 0m is thus approximately 1.00

- Condition: Indoor unit combination ratio does not exceed 100%.

$$\text{Maximum A/C capacity of outdoor units} = \left[\text{A/C capacity of outdoor units obtained from capacity characteristic table at the 100\% combination} \right] \times \left[\text{Capacity change rate due to piping length to the farthest indoor unit} \right]$$

- Condition: Indoor unit combination ratio exceeds 100%.

$$\text{Maximum A/C capacity of outdoor units} = \left[\text{A/C capacity of outdoor units obtained from capacity characteristic table at the combination} \right] \times \left[\text{Capacity change rate due to piping length to the farthest indoor unit} \right]$$

- When overall equivalent pipe length is 90m or more, the diameter of the main gas and liquid pipes (outdoor unit-branch sections) must be increased. When level difference is 50m or more, the diameter of the main liquid pipe (outdoor unit-branch sections) must be increased.

[Diameter of above case]

Model	Gas	Liquid
RQYQ22P	ø 31.8*	ø 19.1

* If available on the site, use this size. Otherwise, not increased.

- Read cooling/heating capacity rate of change in the above figures based on the following equivalent length.

$$\text{Overall equivalent length} = (\text{Equivalent length to main pipe}) \times \text{Correction factor} + (\text{Equivalent length after branching})$$

Choose a correction factor from the following table. [When cooling capacity is calculated: gas pipe size]
[When heating capacity is calculated: liquid pipe size]

Rate of change (object piping)	Correction factor	
	Standard size	Size increase
Cooling (gas pipe)	1.0	0.5
Heating (liquid pipe)	1.0	0.4

(example)

In the above case (Cooling) Overall equivalent length = 80m x 0.5 + 40m = 80m

(Heating) Overall equivalent length = 80m x 0.4 + 40m = 72m

The rate of change in cooling capacity when Hp = 0m is thus approximately 0.86
heating capacity when Hp = 0m is thus approximately 1.0

NOTES

- These figures illustrate the rate of change in capacity of a standard indoor unit system at maximum load (with the thermostat set to maximum) under standard conditions. Moreover, under partial load conditions there is only a minor deviation from the rate of change in capacity shown in the above figures.
- With this outdoor unit, evaporating pressure constant control when cooling and condensing pressure constant control when heating is carried out.
- Method of calculating A/C (cooling/heating) capacity:
The maximum A/C capacity of the system will be either the total A/C capacity of the indoor units obtained from capacity characteristic table or the maximum A/C capacity of outdoor units as mentioned below, whichever smaller.

NOTES

1. All wiring, components and materials to be procured on the site must comply with the applicable local and national codes.
2. Use copper conductors only.
3. As for details, see wiring diagram.
4. Install circuit breaker for safety.
5. All field wiring and components must be provided by licensed electrician.
6. Unit shall be grounded in compliance with the applicable local and national codes.
7. Wiring shown are general points-of-connection guides only and are not intended for or to include all details for a specific installation.
8. Be sure to install the switch and the fuse to the power line of each equipment.
9. Install the main switch that can interrupt all the power sources in an integrated manner because this system consists of the equipment utilizing the multiple power sources.
10. If there exists the possibility of reversed phase, lose phase, momentary blackout or the power goes on and off while the product is operating, attach a reversed phase protection circuit locally.
Running the product in reversed phase may break the compressor and other parts.
11. Must install earth leakage circuit breaker.

12 Installation

12 - 1 Installation Method

RQYQ140P

3D066327

NOTES

- Heights of walls in case of patterns 1 and 2: Front: 1500mm. Suction side: 500 mm. Side: Height unrestricted. Installation space to be shown in this drawing is based on the cooling operation at 35 degrees outdoor air temperature. When the design outdoor air temperature exceeds 35 degrees or the load exceeds maximum ability because of much generation load heat in all outdoor unit, take the suction side space more broadly than the space to be shown in this drawing.
- If the above wall heights are exceeded then h2/2 and h1/2 should be added to the front and suction side service spaces respectively as shown in the figure on the right.
- When installing the units the most appropriate pattern should be selected from those shown above in order to obtain the best fit in the space available always bearing in mind the need to leave enough room for a person to pass between units and wall and for the air to circulate freely. (If more units are to be installed than are catered for in the above patterns your layouts should take account of the possibility of short circuits.)
- The units should be installed to leave sufficient space at the front for the on site refrigerant piping work to be carried out comfortably.
