1 About the documentation

1.1 About this document

Target audience

Authorized installers + end users

Documentation set

This document is part of a documentation set. The complete set consists of:

Document	Contains	Format
General safety precautions	Safety instructions that you must read before installing	Paper (in the box of the outdoor unit)
Outdoor unit installation and operation manual	Installation and operation instructions	
Installer and user reference guide	'	Digital files on http:// www.daikineurope.com/ support-and-manuals/ product-information/.
	 Detailed step-by-step instructions and background information for basic and advanced usage 	

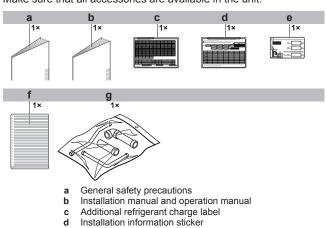

Latest revisions of the supplied documentation may be available on the regional Daikin website or via your dealer.

For the installer

2 About the box

2.1 To remove the accessories from the outdoor unit

Make sure that all accessories are available in the unit.

Fluorinated greenhouse gases label Multilingual fluorinated greenhouse gases label

Piping accessory bag

2.2 **Accessory pipes: Diameters**

Accessory pipes (mm)	HP	Øa	Øb
Gas pipe	8	19).1
 Front connection 	10	25.4	22.2
ID Øa ⊢ ID Øb	12	25.4	28.6

ID Øa	20		

DAIKIN

3 About the units and options

Accessory pipes (mm)	HP	Øa	Øb
Equaliser pipe(a)	8	19	9.1
Front connection	10		
ID Øa ⊢ ID Øb	12	19.1	22.2
	14		
Bottom connection	16		
ID Øa OD Øb	18	25.4	28.6
	20		

(a) Only for RYMQ models.

2.3 To remove the transportation stay

Only for 14~20 HP

NOTICE

If the unit is operated with the transportation stay attached, abnormal vibration or noise may be generated.

The yellow transportation stay installed over the compressor leg for protecting the unit during transport must be removed. Proceed as shown in the figure and procedure below.

- 1 Slightly loosen the fixing nut (A).
- 2 Remove the transportation stay (B) as shown in the figure below
- 3 Tighten the fixing nut (A) again (12.3 N•m).

3 About the units and options

3.1 About the outdoor unit

This installation manual concerns the VRV IV, full inverter driven, heat pump system.

Model line up:

Model	Description
RYYQ8~20 ^(a)	Single continuous heating model.
RYYQ22~54 ^(a)	Multi continuous heating model (consisting of 2 or 3 RYMQ modules).
RXYQ8~20	Single non-continuous heating model.
RXYQ22~54	Multi non-continuous heating model (consisting of 2 or 3 RXYQ modules).

 The RYYQ models provide continuous comfort during defrost operation.

Depending on the type of outdoor unit which is chosen, some functionality will or will not exist. It will be indicated throughout this installation manual and brought to your attention. Certain features have exclusive model rights.

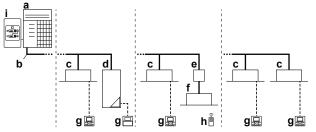

These units are intended for outdoor installation and aimed for heat pump applications including air to air and air to water applications.

3.2 System layout

NOTICE

Design of the system must not be done at temperatures below -15°C .

- a VRV IV Heat pump outdoor unit
- **b** Refrigerant piping
- c VRV direct expansion (DX) indoor unit
- d VRV LT Hydrobox (HXY080/125)
- e BP box (required to connect Residential Air (RA) or Sky Air (SA) direct expansion (DX) indoor units)
- f Residential Air (RA) direct expansion (DX) indoor units)
- g User interface (dedicated depending on indoor unit type)
- h User interface (wireless, dedicated depending on indoor unit type)
- i Cool/Heat changeover remote control switch

4 Preparation

4.1 Preparing refrigerant piping

4.1.1 Refrigerant piping requirements

NOTICE

Refrigerant R410A requires strict cautions for keeping the system clean and dry. Foreign materials (including mineral oils or moisture) should be prevented from getting mixed into the system.

NOTICE

Piping and other pressure containing parts shall comply with the applicable legislation and shall be suitable for refrigerant. Use phosphoric acid deoxidised seamless copper for refrigerant.

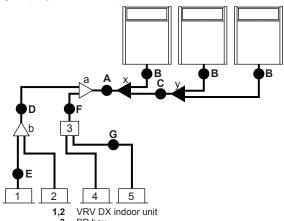

- Foreign materials inside pipes (including oils for fabrication) must be ≤30 mg/10 m.
- Temper grade: use piping with temper grade in function of the pipe diameter as listed in table below.

Pipe Ø (mm)	Temper grade of piping material
≤15.9	O (annealed)
≥19.1	1/2H (half hard)

 All piping lengths and distances have been taken into consideration (see About the piping length in the installer reference guide).

4.1.2 To select the piping size

Determine the proper size referring to following tables and reference figure (only for indication).

- BP box
- RA DX indoor unit 4.5
- Indoor branch kit
- Outdoor multi connection kit

A, B, C: Piping between outdoor unit and (first) refrigerant branch kit

Choose from the following table in accordance with the outdoor unit total capacity type, connected downstream.

Outdoor unit	Piping outer diameter size (mm)		
capacity type (HP)	Gas pipe	Liquid pipe	
8	19.1	9.5	
10	22.2	9.5	
12~16	28.6	12.7	
18~22	28.6	15.9	
24	34.9	15.9	
26~34	34.9	19.1	
36~54	41.3	19.1	

D: Piping between refrigerant branch kits

Choose from the following table in accordance with the indoor unit total capacity type, connected downstream. Do not let the connection piping exceed the refrigerant piping size chosen by the general system model name.

Indoor unit capacity	Piping outer diameter size (mm)		
index	Gas pipe	Liquid pipe	
<150	15.9	9.5	
150≤x<200	19.1		
200≤x<290	22.2		
290≤x<420	28.6	12.7	
420≤x<640		15.9	
640≤x<920	34.9	19.1	
≥920	41.3		

Example:

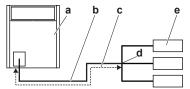

- Downstream capacity for E=capacity index of unit 1
- Downstream capacity for D=capacity index of unit 1+capacity index of unit 2

E: Piping between refrigerant branch kit and indoor unit

Pipe size for direct connection to indoor unit must be the same as the connection size of the indoor unit (in case indoor unit is VRV DX indoor or Hydrobox).

Indoor unit capacity	Piping outer diameter size (mm)		
index	Gas pipe	Liquid pipe	
15~50	12.7	6.4	
63~125	15.9	9.5	
200	19.1		
250	22.2		

When the equivalent pipe length between outdoor and indoor units is 90 m or more, the size of the main pipes (both gas side and liquid side) must be increased. Depending on the length of the piping, the capacity may drop, but even in such a case it is possible to increase the size of the main pipes.

- Outdoor unit
- b Main pipes
- Increase С
- First refrigerant branch kit
- Indoor unit

	Size up			
HP class	Piping outer dia	meter size (mm)		
	Gas pipe	Liquid pipe		
8	19.1 → 22.2	9.5 → 12.7		
10	22.2 → 25.4 ^(a)			
12+14	28.6 ^(b)	12.7 → 15.9		
16	28.6 → 31.8 ^(a)			
18~22		15.9 → 19.1		
24	34.9 ^(b)			
26~34	34.9 → 38.1 ^(a)	19.1 → 22.2		
36~54	41.3 ^(b)			

- If size is NOT available, increase is NOT allowed.
 - Increase is NOT allowed.
- The pipe thickness of the refrigerant piping shall comply with the applicable legislation. The minimal pipe thickness for R410A piping must be in accordance with the table below.

Pipe Ø (mm)	Minimal thickness t (mm)
6.4/9.5/12.7	0.80
15.9	0.99
19.1/22.2	0.80
28.6	0.99
34.9	1.21
41.3	1.43

- In case the required pipe sizes (inch sizes) are not available, it is also allowed to use other diameters (mm sizes), taken the following into account:
- · Select the pipe size nearest to the required size.
- Use the suitable adapters for the change-over from inch to mm pipes (field supply).
- The additional refrigerant calculation has to be adjusted as mentioned in "5.6.3 To determine the additional refrigerant amount" on page 16.

F: Piping between refrigerant branch kit and BP

Pipe size for direct connection on BP unit must be based on the total capacity of the connected indoor units (only in case RA DX indoor units are connected).

Total capacity index	Piping outer diameter size (mm)	
of connected indoor units	Gas pipe	Liquid pipe
20~62	12.7	6.4
63~149	15.9	9.5
150~208	19.1	

Example:

Downstream capacity for F=capacity index of unit 4+capacity index of unit 5

G: Piping between BP unit and RA DX indoor unit

Only in case RA DX indoor units are connected.

Indoor unit capacity	Piping outer diameter size (mm)	
index	Gas pipe	Liquid pipe
20, 25, 30	9.5	6.4
50	12.7	
60		9.5
71	15.9	

4.1.3 To select refrigerant branch kits

Refrigerant refnets

For piping example, refer to "4.1.2 To select the piping size" on page 7.

 When using refinet joints at the first branch counted from the outdoor unit side, choose from the following table in accordance with the capacity of the outdoor unit (example: refinet joint a).

Outdoor unit capacity type (HP)	2 pipes
8~10	KHRQ22M29T9
12~22	KHRQ22M64T
24~54	KHRQ22M75T

 For refnets joints other than the first branch (example refnet joint b), select the proper branch kit model based on the total capacity index of all indoor units connected after the refrigerant branch.

Indoor unit capacity index	2 pipes
<200	KHRQ22M20T
200≤x<290	KHRQ22M29T9
290≤x<640	KHRQ22M64T
≥640	KHRQ22M75T

 Concerning refnet headers, choose from the following table in accordance with the total capacity of all the indoor units connected below the refnet header.

Indoor unit capacity index	2 pipes
<200	KHRQ22M29H
200≤x<290	
290≤x<640	KHRQ22M64H ^(a)
≥640	KHRQ22M75H

(a) If the pipe size above the refnet header is Ø34.9 or more, KHRQ22M75H is required.

INFORMATION

Maximum 8 branches can be connected to a header.

 How to choose an outdoor multi connection piping kit. Choose from the following table in accordance with the number of outdoor units.

Number of outdoor units	Branch kit name
2	BHFQ22P1007
3	BHFQ22P1517

The RYYQ22~54 models, consisting of two or three RYMQ modules, require a 3-pipe system. There is an additional equalising pipe for such modules (in addition to the conventional gas and liquid piping). This equalising pipe does not exist for RYYQ8~20 or RXYQ8~54 units

The equalising pipe connections for the different RYMQ modules are mentioned in below table.

RYMQ	Equalising pipe Ø (mm)
8	19.1
10~16	22.2
18~20	28.6

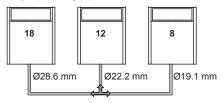

Deciding the equalising pipe diameter:

- In case of 3 multi units: the connection diameter of outdoor to Tjoint has to be kept.
- In case of 2 multi units: the connection pipe has to have the largest diameter.

There is never a connection of the equalising pipe with the indoor units.

Example: (free multi combination)

RYMQ8+RYMQ12+RYMQ18. Largest connection is Ø28.6 (RYMQ18); Ø22.2 (RYMQ12) and Ø19.1 (RYMQ8). In figure below only equalising pipe is shown.

INFORMATION

Reducers or T-joints are field supplied.

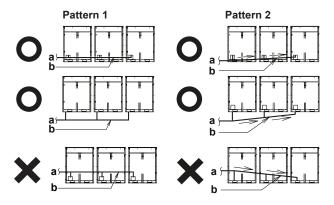

NOTICE

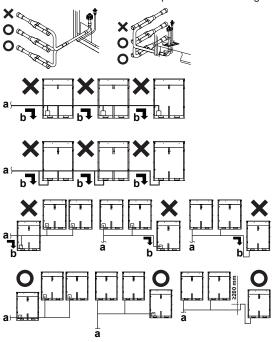

Refrigerant branch kits can only be used with R410A.

4.1.4 Multiple outdoor units: Possible layouts

 The piping between the outdoor units must be routed level or slightly upward to avoid the risk of oil retention into the piping.

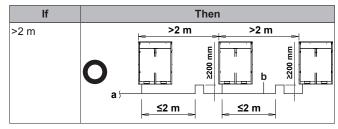

- a To indoor unit
- b Piping between outdoor units
- X Not allowed
- **O** Allowed
- To avoid the risk of oil retention to the outmost outdoor unit, always connect the stop valve and the piping between outdoor units as shown in the 4 correct possibilities of the figure below.

- a To indoor unit
- b Oil collects to the outmost outdoor unit when the system stops
- X Not allowed
- O Allowed
- If the piping length between the outdoor units exceeds 2 m, create a rise of 200 mm or more in the gas line within a length of 2 m from the kit.

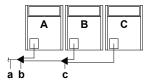

- To indoor unit
- Piping between outdoor units

NOTICE

There are restrictions on the refrigerant pipe connection order between outdoor units during installation in case of a multiple outdoor unit system. Install according to following restrictions. The capacities of outdoor units A, B and C must fulfill the following restriction conditions: A≥B≥C.

- a To indoor units
- **b** Outdoor unit multi connecting piping kit (first branch)
- c Outdoor unit multi connecting piping kit (second branch)

4.2 Preparing electrical wiring

4.2.1 Safety device requirements

The power supply must be protected with the required safety devices, i.e. a main switch, a slow blow fuse on each phase and an earth leakage protector in accordance with the applicable legislation.

For standard combinations

Selection and sizing of the wiring should be done in accordance with the applicable legislation based on the information mentioned in the table below.

Model	Minimum circuit ampere	Recommended fuses
RYYQ8/RYMQ8/RXYQ8	16.1 A	20 A
RYYQ10/RYMQ10/RXYQ10	22.0 A	25 A
RYYQ12/RYMQ12/RXYQ12	24.0 A	32 A
RYYQ14/RYMQ14/RXYQ14	27.0 A	32 A
RYYQ16/RYMQ16/RXYQ16	31.0 A	40 A
RYYQ18/RYMQ18/RXYQ18	35.0 A	40 A
RYYQ20/RYMQ20/RXYQ20	39.0 A	50 A

For all models:

- Phase and frequency: 3N~ 50 Hz
- Voltage: 380-415 V
- Transmission line section: 0.75~1.25 mm², maximum length is 1000 m. If the total transmission wiring exceeds these limits, it may result in communication error.

For non-standard combinations

Calculate the recommended fuse capacity

Formula	Calculate, by adding the minimum circuit ampere of each used unit (according to the table above), multiply the result by 1.1 and select the next higher recommended fuse capacity.
Example	Combining the RXYQ30 by using the RXYQ8, RXYQ10, and RXYQ12.
	Minimum circuit ampere of the RXYQ8=16.1 A
	Minimum circuit ampere of the RXYQ10=22.0 A
	Minimum circuit ampere of the RXYQ12=24.0 A
	Accordingly, the minimum circuit ampere of the RXYQ30=16.1+22.0+24.0=62.1 A
	Multiplying the above result by 1.1 (62.1×1.1)=68.31 A, so the recommended fuse capacity would be 80 A .

NOTICE

When using residual current operated circuit breakers, be sure to use a high-speed type 300 mA rated residual operating current.

5 Installation

5.1 Opening the units

5.1.1 To open the outdoor unit

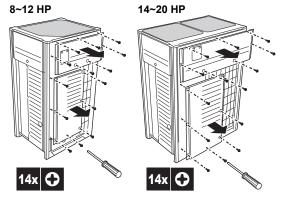

DANGER: RISK OF ELECTROCUTION

DANGER: RISK OF BURNING

To gain access to the unit, front plates need to be opened as follows:

Once the front plates open, the electrical component box can be accessed. See "5.1.2 To open the electrical component box of the outdoor unit" on page 10.

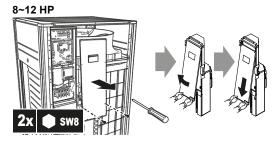

For service purposes, the push buttons on the main PCB need to be accessed. To access these push buttons, the electrical component box cover does not need to be opened. See "6.1.3 To access the field setting components" on page 25.

5.1.2 To open the electrical component box of the outdoor unit

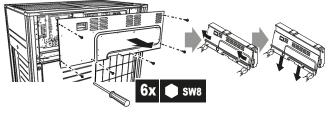

NOTICE

Do not apply excessive force when opening the electronic component box cover. Excessive force can deform the cover, resulting in entering of water to cause equipment failure.

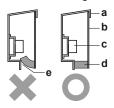

14~20 HP

NOTICE

When closing the electrical component box cover, make sure that the sealing material on the lower back side of the cover is not caught and bend towards the inside.

- a Electrical component box cover
- **b** Front side
- c Power supply terminal block
- d Sealing material
- e Moisture and dirt could enter
- X Not allowed
- O Allowed

5.2 Mounting the outdoor unit

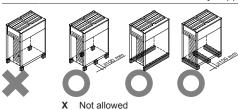

5.2.1 To provide the installation structure

Make sure the unit is installed level on a sufficiently strong base to prevent vibration and noise.

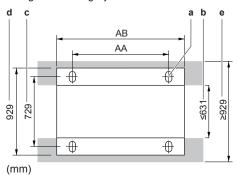

NOTICE

When the installation height of the unit needs to be increased, do not use stands to only support the corners.

O Allowed

- The height of the foundation must at least be 150 mm from the floor. In heavy snowfall areas, this height should be increased, depending on the installation place and condition.
- The unit must be installed on a solid longitudinal foundation (steel beam frame or concrete) and make sure the base under the unit is larger than the grey marked area.

- a Hole for foundation bolt
- b Inner dimension of the base
- c Distance between foundation bolt holes
- d Depth of unit
- e Outer dimension of the base
- A Distance between foundation bolt holes
- AB Longitudinal foundation dimension

HP	AA	AB
8~12	766	992
14~20	1076	1302

 Fasten the unit in place using four foundation bolts M12. It is best to screw in the foundation bolts until their length remains 20 mm above the foundation surface.

NOTICE

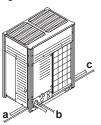

- Prepare a water drainage channel around the foundation to drain waste water from around the unit.
 During heating operation and when the outdoor temperatures are negative, the drained water from the outdoor unit will freeze up. If the water drainage is not taken care of, the area around the unit might be very slippery.
- When installed in a corrosive environment, use a nut with plastic washer (a) to protect the nut tightening part from rust.

5.3 Connecting the refrigerant piping

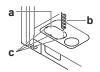

5.3.1 To route the refrigerant piping

Installation of refrigerant piping is possible as front connection or side connection (when taken out from the bottom) as shown in the figure below.

- a Left-side connection
- **b** Front connection
- c Right-side connection

For side connections, the knockout hole on the bottom plate should be removed:

- a Large knockout hole
- **D**rill
- c Points for drilling

NOTICE

Precautions when knocking out knockout holes:

- · Be sure to avoid damaging the casing.
- After knocking out the knockout holes, we recommend you remove the burrs and paint the edges and areas around the edges using repair paint to prevent rusting.
- When passing electrical wiring through the knockout holes, wrap the wiring with protective tape to prevent damage.

5.3.2 To connect the refrigerant piping to the outdoor unit

NOTICE

- Be sure to use the supplied accessory pipes when carrying out piping work in the field.
- Be sure that the field installed piping does not touch other pipes, the bottom panel or side panel. Especially for the bottom and side connection, be sure to protect the piping with suitable insulation, to prevent it from coming into contact with the casing.

Connection from the stop valves to the field piping can be done by using accessory pipes supplied as accessory.

The connections to the branch kits are the responsibility of the installer (field piping).

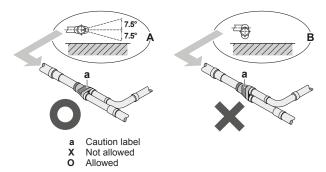

5.3.3 To connect the multi connection piping kit

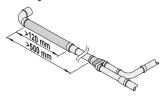

NOTICE

Improper installation may lead to malfunction of the outdoor unit.

- Install the joints horizontally, so that the caution label (a) attached to the joint comes to the top.
 - Do not tilt the joint more than 7.5° (see view A).
 - Do not install the joint vertically (see view B).

 Make sure that the total length of the piping connected to the joint is absolute straight for more than 500 mm. Only if a straight field piping of more than 120 mm is connected, more than 500 mm of straight section can be ensured.

5.3.4 Multiple outdoor units: Knockout holes

Connection	Description
Front connection	Remove the front plate knockout holes to connect.
Bottom connection	Remove the knockout holes on the bottom frame and route the piping under the bottom.

5.3.5 To protect against contamination

Block all gaps in the holes for passing out piping and wiring using sealing material (field supply) (otherwise the capacity of the unit will drop and small animals may enter the machine).

5.3.6 Using the stop valve and service port

To handle the stop valve

- Make sure to keep both stop valves open during operation.
- The stop valve is factory closed.

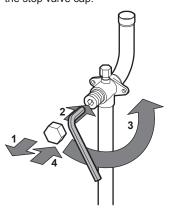

To open the stop valve

- 1 Remove the stop valve cover.
- 2 Insert a hexagon wrench into the stop valve and turn the stop valve counterclockwise.
- 3 When the stop valve cannot be turned any further, stop turning.

Result: The valve is now open.

To fully open the Ø19.1 or Ø25.4 gas line stop valve, turn the hexagonal wrench until a torque between 27 and 33 N•m is achieved.

Inadequate torque may cause leakage of refrigerant and breakage of the stop valve cap.

NOTICE

Pay attention that mentioned torque range is applicable for opening Ø19.1 and Ø25.4 gas line stop valves only.

To close the stop valve

- 1 Remove the stop valve cover.
- 2 Insert a hexagon wrench into the stop valve and turn the stop valve clockwise.
- 3 When the stop valve cannot be turned any further, stop turning.

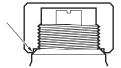

Result: The valve is now closed.

Closing direction:

To handle the stop valve cover

- The stop valve cover is sealed where indicated by the arrow. Take care not to damage it.
- After handling the stop valve, make sure to tighten the stop valve cover securely. For the tightening torque, refer to the table below.
- Check for refrigerant leaks after tightening the stop valve cover.

To handle the service port

- Always use a charge hose equipped with a valve depressor pin, since the service port is a Schrader type valve.
- After handling the service port, make sure to tighten the service port cover securely. For the tightening torque, refer to the table helow
- Check for refrigerant leaks after tightening the service port cover.

Tightening torques

Stop valve	Tightening torque N•m (turn clockwise to close)			
size (mm)	Shaft			
	Valve body	Hexagonal wrench	Cap (valve lid)	Service port
Ø9.5	5.4~6.6	4 mm	13.5~16.5	11.5~13.9
Ø12.7	8.1~9.9		18.0~22.0	
Ø15.9	13.5~16.5	6 mm	23.0~27.0	
Ø19.1	27.0~33.0	8 mm	22.5~27.5	
Ø25.4				

5.3.7 To remove the pinched pipes

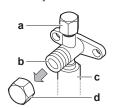

WARNING

Any gas or oil remaining inside the stop valve may blow off the pinched piping.

Failure to observe the instructions in procedure below properly may result in property damage or personal injury, which may be serious depending on the circumstances.

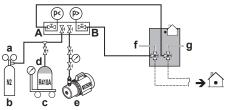

Use the following procedure to remove the pinched piping:

Remove the valve cover and make sure that the stop valves are fully closed.

- Service port and service port cover
- Stop valve b
- Field piping connection
- Connect the vacuuming/recovery unit through a manifold to the service port of all stop valves.

- Pressure reducing valve
- Nitrogen
- Weighing scales
- Refrigerant R410A tank (siphon system)
- Vacuum pump
- Liquid line stop valve
- Gas line stop valve q

- 3 Recover gas and oil from the pinched piping by using a recovery unit.

CAUTION

Do not vent gases into the atmosphere.

- When all gas and oil is recovered from the pinched piping, disconnect the charge hose and close the service ports.
- Cut off the lower part of the gas, liquid and equalising stop valve pipes along the black line. Use an appropriate tool (e.g. a pipe cutter, a pair of nippers).

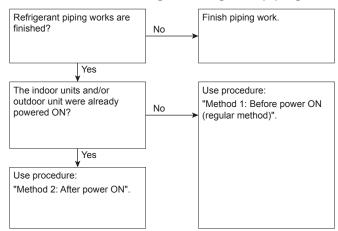

Never remove the pinched piping by brazing.

Any gas or oil remaining inside the stop valve may blow off the pinched piping.

Wait until all oil is dripped out before continuing with the connection of the field piping in case the recovery was not

5.4 Checking the refrigerant piping

About checking the refrigerant piping 5.4.1

It is very important that all refrigerant piping work is done before the units (outdoor or indoor) are powered on.

When the units are powered on, the expansion valves will initialise. This means that they will close. Leak test and vacuum drying of field piping and indoor units is impossible when this happens.

Therefore, there will be explained 2 methods for initial installation, leak test and vacuum drying.

Method 1: Before power ON

If the system has not yet been powered on, no special action is required to perform the leak test and the vacuum drying.

Method 2: After power ON

If the system has already been powered on, apply outdoor unit setting [2-21]=1 (refer to "6.1.8 Mode 2: Field settings" on page 27). This setting will open field expansion valves to guarantee a R410A piping pathway and make it possible to perform the leak test and the vacuum drying.

NOTICE

Make sure that all indoor units connected to the outdoor unit are powered on.

NOTICE

Wait until the outdoor unit has finished the initialisation to apply setting [2-21].

Leak test and vacuum drying

Checking the refrigerant piping involves:

- · Checking for any leakages in the refrigerant piping.
- Performing vacuum drying to remove all moisture, air or nitrogen in the refrigerant piping.

If there is a possibility of moisture being present in the refrigerant piping (for example, rainwater may have entered the piping), first carry out the vacuum drying procedure below until all moisture has been removed.

All piping inside the unit has been factory tested for leaks.

Only field installed refrigerant piping needs to be checked. Therefore, make sure that all the outdoor unit stop valves are firmly closed before performing leak test or vacuum drying.

NOTICE

Make sure that all (field supplied) field piping valves are OPEN (not outdoor unit stop valves!) before you start leak test and vacuuming.

For more information on the state of the valves, refer to "5.4.3 Checking refrigerant piping: Setup" on page 14.

5.4.2 Checking refrigerant piping: General guidelines

Connect the vacuum pump through a manifold to the service port of all stop valves to increase efficiency (refer to "5.4.3 Checking refrigerant piping: Setup" on page 14).

NOTICE

Use a 2-stage vacuum pump with a non-return valve or a solenoid valve that can evacuate to a gauge pressure of -100.7 kPa (5 Torr absolute).

NOTICE

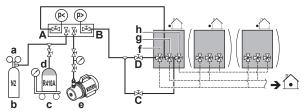

Make sure the pump oil does not flow oppositely into the system while the pump is not working.

NOTICE

Do not purge the air with refrigerants. Use a vacuum pump to evacuate the installation.

5.4.3 Checking refrigerant piping: Setup

- a Pressure reducing valve
- **b** Nitrogen
- c Weighing scales
- d Refrigerant R410A tank (siphon system)
- e Vacuum pump
- f Liquid line stop valve
- Gas line stop valve
- h Equalising line stop valve (only for RYMQ)
- A Valve A
- B Valve B

Valve C Valve D

Valve	State of valve
Valve A	Open
Valve B	Open
Valve C	Open
Valve D	Open
Liquid line stop valve	Close
Gas line stop valve	Close
Equalising line stop valve	Close

NOTICE

The connections to the indoor units and all indoor units should also be leak and vacuum tested. Keep any possible (field supplied) field piping valves open as well.

Refer to the indoor unit installation manual for more details. Leak test and vacuum drying should be done before the power supply is set to the unit. If not, see also the flow chart earlier described in this chapter (see "5.4.1 About checking the refrigerant piping" on page 13).

5.4.4 To perform a leak test

The leak test must satisfy the specifications of EN 378-2.

To check for leaks: Vacuum leak test

- 1 Evacuate the system from the liquid and gas piping to -100.7 kPa (-1.007 bar/5 Torr) for more than 2 hours.
- 2 Once reached, turn off the vacuum pump and check that the pressure does not rise for at least 1 minute.
- 3 Should the pressure rise, the system may either contain moisture (see vacuum drying below) or have leaks.

To check for leaks: Pressure leak test

- 1 Break the vacuum by pressurising with nitrogen gas to a minimum gauge pressure of 0.2 MPa (2 bar). Never set the gauge pressure higher than the maximum operation pressure of the unit, i.e. 4.0 MPa (40 bar).
- 2 Test for leaks by applying a bubble test solution to all piping connections.
- 3 Discharge all nitrogen gas.

NOTICE

Make sure to use a recommended bubble test solution from your wholesaler. Do not use soap water, which may cause cracking of flare nuts (soap water may contain salt, which absorbs moisture that will freeze when the piping gets cold), and/or lead to corrosion of flared joints (soap water may contain ammonia which causes a corrosive effect between the brass flare nut and the copper flare.

5.4.5 To perform vacuum drying

To remove all moisture from the system, proceed as follows:

- 1 Evacuate the system for at least 2 hours to a target vacuum of -100.7 kPa (-1.007 bar/5 Torr).
- **2** Check that, with the vacuum pump turned off, the target vacuum is maintained for at least 1 hour.
- 3 Should you fail to reach the target vacuum within 2 hours or maintain the vacuum for 1 hour, the system may contain too much moisture. In that case, break the vacuum by pressurising with nitrogen gas to a gauge pressure of 0.05 MPa (0.5 bar) and repeat steps 1 to 3 until all moisture has been removed.
- 4 Depending on whether you want to immediately charge refrigerant through the refrigerant charge port or first pre-charge a portion of refrigerant through the liquid line, either open the outdoor unit stop valves, or keep them closed. See "5.6.2 About charging refrigerant" on page 16 for more information.

5.5 To insulate the refrigerant piping

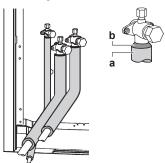

After finishing the leak test and vacuum drying, the piping must be insulated. Take into account the following points:

- Make sure to insulate the connection piping and refrigerant branch kits entirely.
- Be sure to insulate the liquid and gas piping (for all units).
- Use heat resistant polyethylene foam which can withstand a temperature of 70°C for liquid piping and polyethylene foam which can withstand a temperature of 120°C for gas piping.
- Reinforce the insulation on the refrigerant piping according to the installation environment.

Ambient temperature	Humidity	Minimum thickness
≤30°C	75% to 80% RH	15 mm
>30°C	≥80% RH	20 mm

Condensation might form on the surface of the insulation.

 If there is a possibility that condensation on the stop valve might drip down into the indoor unit through gaps in the insulation and piping because the outdoor unit is located higher than the indoor unit, this must be prevented by sealing up the connections. See below figure.

- a Insulation material
- b Caulking etc.

5.6 Charging refrigerant

5.6.1 Precautions when charging refrigerant

WARNING

- Only use R410A as refrigerant. Other substances may cause explosions and accidents.
- R410A contains fluorinated greenhouse gases covered by the Kyoto Protocol. Its global warming potential value is 1975. Do NOT vent these gases into the atmosphere.
- When charging refrigerant, always use protective gloves and safety glasses.

NOTICE

If the power of some units is turned off, the charging procedure cannot be finished properly.

NOTICE

In case of a multiple outdoor system, turn on the power of all outdoor units.

NOTICE

Be sure to turn on the power 6 hours before operation in order to have power running to the crankcase heater and to protect the compressor.

NOTICE

If operation is performed within 12 minutes after the indoor and outdoor units are turned on, the compressor will not operate before the communication is established in a correct way between outdoor unit(s) and indoor units.

NOTICE

Before starting charging procedures, check if the 7-segment display indication of the outdoor unit A1P PCB is as normal (see "6.1.4 To access mode 1 or 2" on page 25). If a malfunction code is present, see "8.1 Solving problems based on error codes" on page 30.

NOTICE

Make sure all connected indoor units are recognised (see [1-10], [1-38] and [1-39] in "6.1.7 Mode 1: Monitoring settings" on page 26).

NOTICE

Close the front panel before any refrigerant charge operation is executed. Without the front panel attached the unit cannot judge correctly whether it is operating properly or not.

NOTICE

In case of maintenance and the system (outdoor unit+field piping+indoor units) does not contain any refrigerant any more (e.g., after refrigerant reclaim operation), the unit has to be charged with its original amount of refrigerant (refer to the nameplate on the unit) by pre-charging before the automatic charging function can be started.

5.6.2 About charging refrigerant

Once vacuum drying is finished, additional refrigerant charging can start.

There are two methods to charge additional refrigerant.

Method	See
· ·	"5.6.6 Step 6a: To automatically charge refrigerant" on page 20
ŭ	"5.6.7 Step 6b: To manually charge refrigerant" on page 21

INFORMATION

Adding refrigerant using the automatic refrigerant charging function is not possible when Hydrobox units or RA DX indoor units are connected to the system.

To speed up the refrigerant charging process, it is in case of larger systems recommended to first pre-charge a portion of refrigerant through the liquid line before proceeding with the actual automatic or manual charging. This step is included in below procedure (see "5.6.5 To charge refrigerant" on page 19). It can be skipped, but charging will take longer then.

A flow chart is available which gives an overview of the possibilities and actions to be taken (see "5.6.4 To charge refrigerant: Flow chart" on page 17).

5.6.3 To determine the additional refrigerant amount

NOTICE

The refrigerant charge of the system must be less than 100 kg. This means that in case the calculated total refrigerant charge is equal to or more than 95 kg you must divide your multiple outdoor system into smaller independent systems, each containing less than 95 kg refrigerant charge. For factory charge, refer to the unit name plate.

Additional refrigerant to be charged=R (kg). R should be rounded off in units of 0.1 kg.

 $R=[(X_1 \times \emptyset 22.2) \times 0.37 + (X_2 \times \emptyset 19.1) \times 0.26 + (X_3 \times \emptyset 15.9) \times 0.18 + (X_4 \times \emptyset 12.7) \times 0.12 + (X_5 \times \emptyset 9.5) \times 0.059 + (X_6 \times \emptyset 6.4) \times 0.022] + A + B$

X_{1...6} =Total length (m) of liquid piping size at **Øa**

Piping length	Total indoor unit	Αp	arameter (kg)
	capacity CR ^(a)	8 HP	10~16 HP	18~20 HP
≤30 m	50%≤CR≤105%	()	0.5
	105% <cr≤130%< td=""><td>0</td><td>.5</td><td>1</td></cr≤130%<>	0	.5	1
>30 m	50%≤CR≤70%	0 0.5		0.5
	70% <cr≤85%< td=""><td>0.3</td><td>0.5</td><td>1.0</td></cr≤85%<>	0.3	0.5	1.0
	85% <cr≤105%< td=""><td>0.7</td><td>1</td><td>1.5</td></cr≤105%<>	0.7	1	1.5
	105% <cr≤130%< td=""><td>1.2</td><td>1.5</td><td>2.0</td></cr≤130%<>	1.2	1.5	2.0

(a) CR=Connection ratio.

INFORMATION

- When using multi models, add the sum of individual HP modules.
- Piping length is considered the distance from the outdoor unit to the farthest indoor unit.

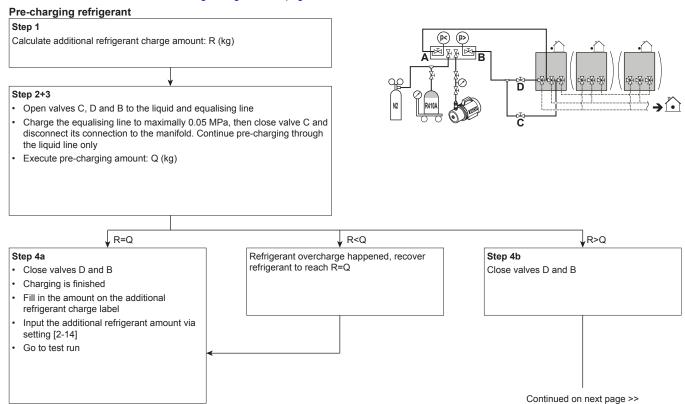

Model	B parameter (kg) ^(a)
RYYQ8+RYYQ10+RYYQ12	0.9
RYYQ14+RYYQ16	1.1
RYYQ18+RYYQ20	1.3

(a) B parameter is ONLY required for RYYQ8~20 models, NOT for RXYQ8~54 and RYYQ22~54. When using metric piping, please take into account following table concerning the weight factor to be allocated. It should be substituted in the formula for R.

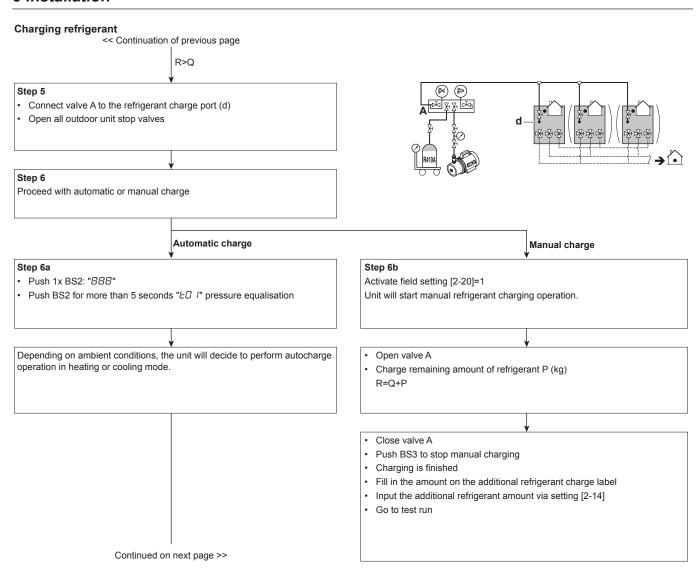

Inch piping		Metric piping	
size (Ø) (mm)	Weight factor	size (Ø) (mm)	Weight factor
6.4	0.022	6	0.018
9.52	0.059	10	0.065
12.7	0.12	12	0.097
15.9	0.18	15	0.16
_	_	16	0.18
19.1	0.26	18	0.24
22.2	0.37	22	0.35

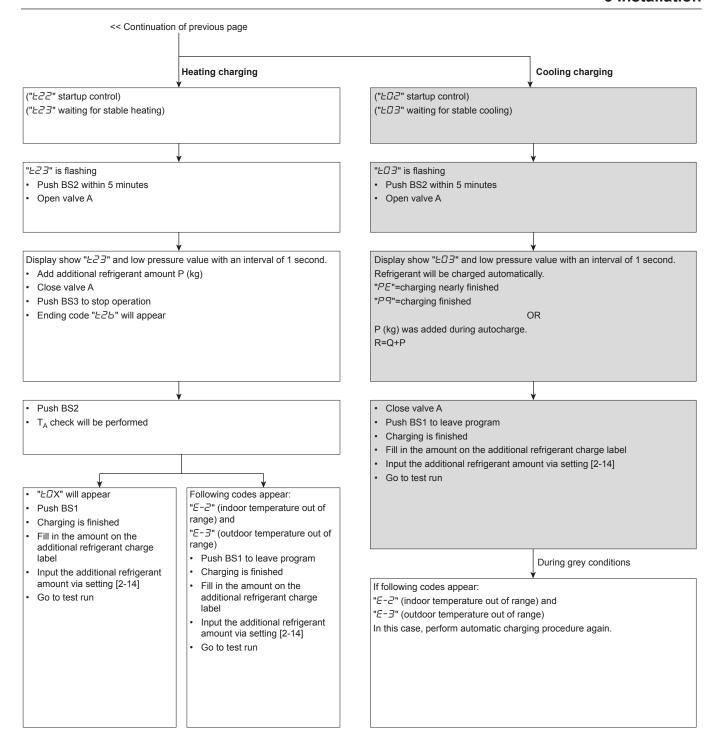

5.6.4 To charge refrigerant: Flow chart

For more information, see "5.6.5 To charge refrigerant" on page 19.

5 Installation

5.6.5 To charge refrigerant

Follow the steps as described below and take into account whether you want to use the automatic charge function or not.

Pre-charging refrigerant

- 1 Calculate the additional amount of refrigerant to be added using the formula mentioned in "5.6.3 To determine the additional refrigerant amount" on page 16.
- 2 The first 10 kg of additional refrigerant can be pre-charged without outdoor unit operation.

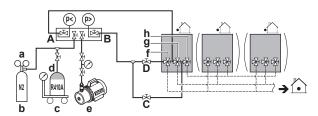

If	Then
The additional refrigerant amount is smaller than 10 kg	Perform steps 3~4.
The additional refrigerant charge is larger than 10 kg	Perform steps 3~6.

3 Pre-charging can be done without compressor operation, by connecting the refrigerant bottle to the service ports of the liquid and equalising stop valves (open valve B). Make sure that valve A and all outdoor unit stop valves are closed.

NOTICE

During pre-charging, the refrigerant is charged through the liquid line. Close valve A and disconnect the manifold from the gas line. The equalising line is ONLY charged to break the vacuum. Charge it to maximally 0.05 MPa, then close valve C and disconnect its connection to the manifold. Continue pre-charging through the liquid line only.

- Pressure reducing valve
- **b** Nitrogen
- c Weighing scales
- d Refrigerant R410A tank (siphon system)
- e Vacuum pump
- f Liquid line stop valve
- g Gas line stop valve
- h Equalising line stop valve (only for RYMQ)
- A Valve A
- B Valve B
- C Valve C
- D Valve D
- 4 Do one of the following:

	lf	Then
4a	The calculated additional refrigerant amount is reached by above pre-charging procedure	Close valves D and B and disconnect the manifold connection to the liquid line.
4b	The total amount of refrigerant could not be charged by pre-charging	Close valves D and B, disconnect the manifold connection to the liquid line, and perform steps 5~6.

INFORMATION

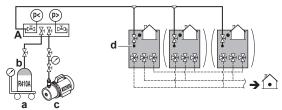

If the total additional refrigerant amount was reached in step 4 (by pre-charging only), record the amount of refrigerant that was added on the additional refrigerant charge label provided with the unit and attach it on the back side of the front panel.

Additionally, input the additional refrigerant amount into the system via setting [2-14].

Perform the test procedure as described in "7 Commissioning" on page 28.

Charging refrigerant

5 After pre-charging, connect valve A to the refrigerant charge port and charge the remaining additional refrigerant through this port. Open all outdoor unit stop valves. At this point, valve A must remain closed!

- a Weighing scales
- b Refrigerant R410A tank (siphon system)
- c Vacuum pump
- d Refrigerant charge port
- A Valve A

INFORMATION

For a multi outdoor unit system, it is not required to connect all charge ports to a refrigerant tank.

The refrigerant will be charged with ±22 kg in 1 hour time at an outdoor temperature of 30°C DB or with ±6 kg at an outdoor temperature of 0°C DB.

If you need to speed up in case of a multiple outdoor system, connect the refrigerant tanks to each outdoor unit.

NOTICE

- The refrigerant charging port is connected to the piping inside the unit. The unit's internal piping is already factory charged with refrigerant, so be careful when connecting the charge hose.
- After adding the refrigerant, do not forget to close the lid of the refrigerant charging port. The tightening torque for the lid is 11.5 to 13.9 N·m.
- In order to ensure uniform refrigerant distribution, it may take the compressor ±10 minutes to start up after the unit has started operation. This is not a malfunction.

6 Proceed with one of the following:

	"5.6.6 Step 6a: To automatically charge refrigerant" on page 20
6b	"5.6.7 Step 6b: To manually charge refrigerant" on page 21

INFORMATION

After charging refrigerant:

- Record the additional refrigerant amount on the refrigerant label provided with the unit and attach it to the backside of the front panel.
- Input the additional refrigerant amount into the system via setting [2-14].
- Perform the test procedure described in "7 Commissioning" on page 28.

5.6.6 Step 6a: To automatically charge refrigerant

INFORMATION

The automatic refrigerant charging has limits as described below. Out of these limits, the system cannot operate the automatic refrigerant charging:

Outdoor temperature: 0~43°C DB.
 Indoor temperature: 10~32°C DB.
 Total indoor unit capacity: ≥80%.

When "£23" or "£03" starts flashing (ready for charging), push BS2 within 5 minutes. Open valve A. If BS2 is not pushed within 5 minutes, a malfunction code will appear:

If	Then
Heating operation	"ヒ己b" will be flashing. Push BS2 to restart the procedure.
Cooling operation	Malfunction code "PZ" will appear. Push BS1 to abort and restart the procedure.

Test run including detailed refrigerant status check is required to use the leak detection functionality. More information, see "7 Commissioning" on page 28.

If	Then
" <i>E0 1</i> ", " <i>E02</i> ", or " <i>E03</i> " appears	Push BS1 to finish the automatic charging function procedure. The ambient conditions are favourable to execute the test run.
"E-2", or "E-3" appears	The ambient conditions are NOT favourable to execute the test run. Push BS1 to finish the automatic charging procedure.

INFORMATION

In case a malfunction code occurred during this automatic charging procedure, the unit will stop and indicate " \mathcal{LZB} " flashing. Push BS2 to restart the procedure.

INFORMATION

- When a malfunction is detected during the procedure (e.g, in case of closed stop valve), a malfunction code will be displayed. In that case, refer to "8.1 Solving problems based on error codes" on page 30 and solve the malfunction accordingly. Resetting the malfunction can be done by pushing BS1. The procedure can be restarted from "5.6.6 Step 6a: To automatically charge refrigerant" on page 20.
- Aborting the automatic refrigerant charge is possible by pushing BS1. The unit will stop and return to idle condition.

5.6.7 Step 6b: To manually charge refrigerant

INFORMATION

The manual refrigerant charge operation will automatically stop within 30 minutes. If charging is not completed after 30 minutes, perform the additional refrigerant charging operation again.

INFORMATION

- When a malfunction is detected during the procedure (e.g., in case of closed stop valve), a malfunction code will be displayed. In that case, refer to "5.6.8 Error codes when charging refrigerant" on page 21 and solve the malfunction accordingly. Resetting the malfunction can be done by pushing BS3. The procedure can be restarted from "5.6.7 Step 6b: To manually charge refrigerant" on page 21.
- Aborting the manual refrigerant charge is possible by pushing BS3. The unit will stop and return to idle condition.

5.6.8 Error codes when charging refrigerant

Code	Cause	Solution
P2	Unusual low pressure on suction line	Close valve A immediately. Push BS1 to reset. Check following items before retrying autocharge procedure:
		 Check if the gas side stop valve is opened correctly.
		 Check if the valve of the refrigerant cylinder is opened.
		 Check if the air inlet and outlet of the indoor unit are not obstructed.
P8	Freeze-up prevention indoor unit	Close valve A immediately. Push BS1 to reset. Retry autocharge procedure.
E-2	Indoor unit is out of temperature range for leak detection operation	Retry when ambient conditions are satisfied.
E-3	Outdoor unit is out of temperature range for leak detection operation	Retry when ambient conditions are satisfied.
E-5	Indicates an indoor unit which is not compatible with leak detection functionality is installed (e.g., RA DX indoor unit, Hydrobox,)	Refer to requirements to be able to execute leak detection operation.
Other malfunction code		Close valve A immediately. Confirm the malfunction code and take corresponding action, "8.1 Solving problems based on error codes" on page 30.

5.6.9 Checks after charging refrigerant

- Are all stop valves open?
- Is the amount of refrigerant, that has been added, recorded on the refrigerant charge label?

NOTICE

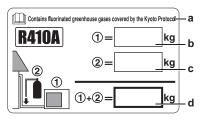

Make sure to open all stop valves after (pre-) charging the refrigerant.

Operating with the stop valves closed will damage the compressor.

5.6.10 To fix the fluorinated greenhouse gases label

Sticking instructions are illustrated on the backside of that label.

1 Fill in the label as follows:

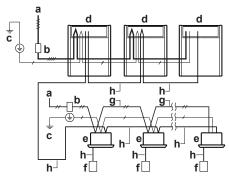

- From the multilingual fluorinated greenhouse gases label peal off the applicable language and stick it on top of ${\bf a}$.
- Factory refrigerant charge: see unit name plate Additional refrigerant amount charged
- Total refrigerant charge
- The filled out label must be adhered on the inside of the product and in the proximity of the product charging port (e.g., on the inside of the service cover).

5.7 Connecting the electrical wiring

5.7.1 Field wiring: Overview

Field wiring consists of power supply (always including earth) and indoor-outdoor communication (= transmission) wiring.

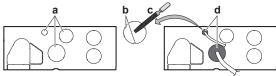

Example:

- Field power supply (with earth leakage protector)
- b Main switch
- Earth connection
- Outdoor unit
- Indoor unit
- Power supply wiring (sheathed cable) (230 V)
- Transmission wiring (sheathed cable) (16 V) Power supply 3N~ 50 Hz
- Power supply 1~ 50 Hz
- Earth wiring

5.7.2 Guidelines when knocking out knockout holes

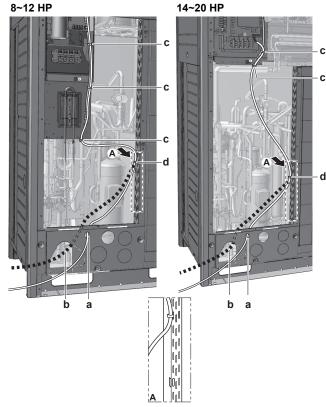

- To punch a knockout hole, hit on it with a hammer.
- · After knocking out the holes, we recommend removing any burrs and paint the edges and areas around the holes using repair paint to prevent rusting.
- When passing electrical wiring through the knockout holes. prevent damage to the wires by wrapping the wiring with protective tape, putting the wires through field supplied protective wire conduits at that location, or install suitable field supplied wire nipples or rubber bushings into the knockout holes.

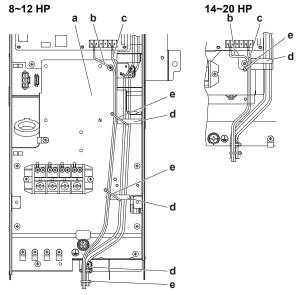

- Knockout hole
- b Burr
- Remove burrs
- If there are any possibilities that small animals enter the system through the knockout holes, plug the holes with packing materials (to be prepared on-site)

5.7.3 To route and fix the transmission wiring

Transmission wiring can be routed through the front side only. Fix it to the upper mounting hole.

- Transmission wiring (possibility 1)^{(a}
- Transmission wiring (possibility $2)^{(a)}$. Fix to pipe insulation with tie wraps
- Tie wrap. Fix to factory-mounted low voltage wiring.
- Tie wrap.
- Knockout hole has to be removed. Close the hole to avoid small animals or dirt from entering

- Fix to the indicated plastic brackets using field supplied clamping material
- Wiring between the units (indoor-outdoor) (F1/F2 left) Internal transmission wiring (Q1/Q2)
- Plastic bracket
- Field supplied clamps

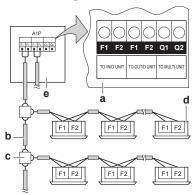

5.7.4 To connect the transmission wiring

The wiring from the indoor units must be connected to the F1/F2 (In-Out) terminals on the PCB in the outdoor unit.

Tightening torque of the transmission wiring terminals:

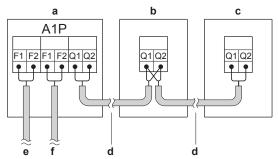

Screw size	Tightening torque (N•m)
M3.5 (A1P)	0.80~0.96

In case of single outdoor unit installation

- Outdoor unit PCB (A1P)
- Use the conductor of sheathed wire (2 wire) (no polarity) h
- Terminal board (field supply)
- Indoor unit
- Outdoor unit

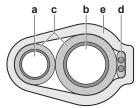

In case of multi outdoor unit installation

- Unit A (master outdoor unit)
- Unit B (slave outdoor unit)
- Unit C (slave outdoor unit)
- Master/slave transmission (Q1/Q2) d
- Outdoor/indoor transmission (F1/F2)
- Outdoor unit/other system transmission (F1/F2)
- The interconnecting wiring between the outdoor units in the same piping system must be connected to the Q1/Q2 (Out Multi) terminals. Connecting the wires to the F1/F2 terminals results in system malfunction.
- The wiring for the other systems must be connected to the F1/F2 (Out-Out) terminals of the PCB in the outdoor unit to which the interconnecting wiring for the indoor units is connected.
- The base unit is the outdoor unit to which the interconnecting wiring for the indoor units is connected.

5.7.5 To finish the transmission wiring

After installing the transmission wires inside the unit, wrap them along with the on-site refrigerant pipes using finishing tape, as shown in figure below.

- Liquid pipe
- b Gas pipe
- Insulator
- Transmission wiring (F1/F2)
- Finishing tape

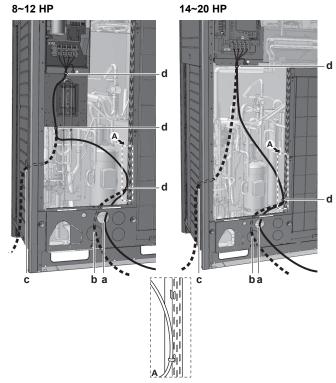

5.7.6 To route and fix the power supply

NOTICE

When routing earth wires, secure clearance of 25 mm or more away from compressor lead wires. Failure to observe this instruction properly may adversely affect correct operation of other units connected to the same earth.

The power supply wiring can be routed from the front and left side. Fix it to the lower mounting hole.

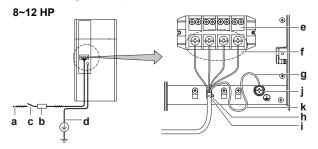

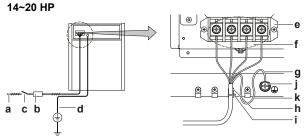

- Power supply (possibility 1)(a)
- b
- Power supply (possibility 2)^(a)
 Power supply (possibility 3)^(a). Use conduit. С
- Tie wrap
- Knockout hole has to be removed. Close the hole to avoid small animals or dirt from entering.

5.7.7 To connect the power supply

The power supply must be clamped to the plastic bracket using field supplied clamp material.

The green and yellow striped wire must be used for earthing only (refer to the figure below).

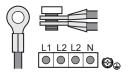

- a Power supply (380~415 V 3N~ 50Hz)
- **b** Fuse
- c Earth leakage protector
- d Earth wire
- e Power supply terminal block
- f Connect each power wire: RED to L1, WHT to L2, BLK to L3 and BLU to N
- g Earth wire (GRN/YLW)
- K Clamp the power supply to the plastic bracket using a field supplied clamp to prevent external force being applied to the terminal.
- i Clamp (field supplied)
- j Cup washer
- When connecting the earth wire, it is recommended to perform curling.

Multiple outdoor units

To connect the power supply for multiple outdoor units to each other, ring tongues have to be used. No bare cable can be used.

The ring washer which is standard provided should be removed in that case.

Attaching both cables to the power supply terminal should be done as indicated.

6 Configuration

INFORMATION

It is important that all information in this chapter is read sequentially by the installer and that the system is configured as applicable.

DANGER: RISK OF ELECTROCUTION

6.1 Making field settings

6.1.1 About making field settings

To continue the configuration of the VRV IV heat pump system, it is required to give some input to the PCB of the unit. This chapter will describe how manual input is possible by operating the push buttons/DIP switches on the PCB and reading the feedback from the 7-segment displays.

Making settings is done via the master outdoor unit.

Next to making field settings it is also possible to confirm the current operation parameters of the unit.

Push buttons and DIP switches

Item	Description
Push buttons	By operating the push buttons it is possible to:
	 Perform special actions (automatic refrigerant charge, testrun, etc).
	 Perform field settings (demand operation, low noise, etc).
DIP switches	By operating the DIP switches it is possible to:
	 DS1 (1): COOL/HEAT selector (refer to the manual of the cool/heat selector switch). OFF=not installed=factory setting
	 DS1 (2~4): NOT USED. DO NOT CHANGE THE FACTORY SETTING.
	 DS2 (1~4): NOT USED. DO NOT CHANGE THE FACTORY SETTING.

See also:

- "6.1.2 Field setting components" on page 25
- "6.1.3 To access the field setting components" on page 25

PC configurator

For VRV IV heat pump system it is alternatively possible to make several commissioning field settings through a personal computer interface (for this, option EKPCCAB is required). The installer can prepare the configuration (off-site) on PC and afterwards upload the configuration to the system.

See also: "6.1.9 To connect the PC configurator to the outdoor unit" on page 28.

Mode 1 and 2

Mode	Description
Mode 1	Mode 1 can be used to monitor the current
	situation of the outdoor unit. Some field setting contents can be monitored as well.

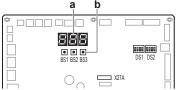

Mode	Description
Mode 2	Mode 2 is used to change the field settings of the system. Consulting the current field setting
(field settings)	value and changing the current field setting value is possible.
	In general, normal operation can be resumed without special intervention after changing field settings.
	Some field settings are used for special operation (e.g., 1 time operation, recovery/ vacuuming setting, manual adding refrigerant setting, etc.). In such a case, it is required to abort the special operation before normal operation can restart. It will be indicated in below explanations.

See also:

- "6.1.4 To access mode 1 or 2" on page 25
- "6.1.5 To use mode 1" on page 26
- "6.1.6 To use mode 2" on page 26
- "6.1.7 Mode 1: Monitoring settings" on page 26
- "6.1.8 Mode 2: Field settings" on page 27

6.1.2 Field setting components

Location of the 7-segment displays, buttons and DIP switches:

BS1 MODE: For changing the set mode

BS2 SET: For field setting

BS3 RETURN: For field setting

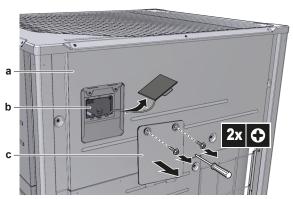

DS1, DS2 DIP switches

a 7-segment displaysb Push buttons

6.1.3 To access the field setting components

It is not required to open the complete electronic component box to access the push buttons on the PCB and read out the 7-segment display(s).

To access you can remove the front inspection cover of the front plate (see figure). Now you can open the inspection cover of the electrical component box front plate (see figure). You can see the three push buttons and the 3 7-segment displays and DIP switches.

- a Service cover
- **b** Main PCB with 3 7-segment displays and 3 push buttons
- c Electrical component box service cover

Operate the switches and push buttons with an insulated stick (such as a closed ball-point pen) to avoid touching of live parts.

Make sure to re-attach the inspection cover into the electronic component box cover and to close the front plate's inspection cover after the job is finished. During operation of the unit the front plate of the unit should be attached. Settings are still possible to be made through the inspection opening.

NOTICE

Make sure that all outside panels, except for the service cover on the electrical component box, are closed while working.

Close the lid of the electrical component box firmly before turning on the power.

6.1.4 To access mode 1 or 2

Initialisation: default situation

NOTICE

Be sure to turn on the power 6 hours before operation in order to have power running to the crankcase heater and to protect the compressor.

Turn on the power supply of the outdoor unit and all indoor units. When the communication between indoor units and outdoor unit(s) is established and normal, the 7-segment display indication state will be as below (default situation when shipped from factory).

Stage	Display
When turning on the power supply: flashing as indicated. First checks on power supply are executed (1~2 min).	
When no trouble occurs: lighted as indicated (8~10 min).	
Ready for operation: blank display indication as indicated.	888

7-segment display indications:

When above situation cannot be confirmed after 12 min, the malfunction code can be checked on the indoor unit user interface and the outdoor unit 7-segment display. Solve the malfunction code accordingly. The communication wiring should be checked at first.

Access

BS1 is used to change the mode you want to access.

Access	Action
Mode 1	Push BS1 one time.
	7-segment display indication changes to:
Mode 2	Push BS1 for at least 5 seconds.
	7-segment display indication changes to:
	2 2

INFORMATION

If you get confused in the middle of the process, push BS1. Then it returns to idle situation (no indication on 7-segment displays: blank, refer to "6.1.4 To access mode 1 or 2" on page 25.

6.1.5 To use mode 1

Mode 1 is used to set basic settings and to monitor the status of the unit.

What	How
Changing and accessing the setting in mode 1	Once mode 1 is selected (push BS1 1 time), you can select the wanted setting. It is done by pushing BS2.
	Accessing the selected setting's value is done by pushing BS3 1 time.
To quit and return to the initial status	Press BS1.

6.1.6 To use mode 2

The master unit should be used to input field settings in mode 2.

Mode 2 is used to set field settings of the outdoor unit and system.

What	How
Changing and accessing the setting in mode 2	Once mode 2 is selected (push BS1 for more than 5 seconds), you can select the wanted setting. It is done by pushing BS2.
	Accessing the selected setting's value is done by pushing BS3 1 time.
To quit and return to the initial status	Press BS1.
Changing the value of the selected setting in mode 2	 Once mode 2 is selected (push BS1 for more than 5 seconds) you can select the wanted setting. It is done by pushing BS2.
	Accessing the selected setting's value is done by pushing BS3 1 time.
	 Now BS2 is used to select the required value of the selected setting.
	 When the required value is selected, you can define the change of value by pushing BS3 1 time.
	Press BS3 again to start operation according to the chosen value.

6.1.7 Mode 1: Monitoring settings

[1-0]

Shows whether the unit you check is a master, slave 1 or slave 2 unit.

The master unit should be used to input field settings in mode 2.

[1-0]	Description
No indication	Undefined situation.
0	Outdoor unit is master unit.
1	Outdoor unit is slave 1 unit.
2	Outdoor unit is slave 2 unit.

[1-1]

Shows the status of low noise operation.

[1-1]	Description
	Unit is currently not operating under low noise restrictions.
	Unit is currently operating under low noise restrictions.

[1-2]

Shows the status of power consumption limitation operation.

[1-2]	Description
0	Unit is currently not operating under power consumption limitations.
1	Unit is currently operating under power consumption limitation.

[1-5] [1-6]

Shows:

- [1-5]: The current T_e target parameter position.
- [1-6]: The current T_c target parameter position.

[1-10]

Shows the total number of connected indoor units.

[1-13]

Shows the total number of connected outdoor units (in case of multiple outdoor system).

[1-17] [1-18] [1-19]

Shows:

- [1-17]: The latest malfunction code.
- [1-18]: The 2nd last malfunction code.
- [1-19]: The 3rd last malfunction code.

[1-29] [1-30] [1-31]

Shows the estimated leaked refrigerant amount (kg) based on:

- [1-29]: The latest leak detection operation.
- [1-30]: The 2nd last leak detection operation.
- [1-31]: The 3rd last leak detection operation.

[1-34]

Shows the remaining days till the next automatic leak detection (if automatic leak detection function is activated).

[1-35] [1-36] [1-37]

Shows the result of:

- [1-35]: The latest automatic leak detection execution.
- [1-36]: The 2nd last automatic leak detection operation.
- [1-37]: The 3rd last automatic leak detection operation.

[1-35] [1-36] [1-37]	Description
1	Normal execution of leak detection operation occurred.
2	Operation conditions during leak detection operation were not satisfied (ambient temperature was not within the limitations).
3	Malfunction occurred during leak detection operation.

lf	Then the estimated leaked refrigerant amount is displayed in
[1-35]=1	[1-29]
[1-36]=1	[1-30]
[1-37]=1	[1-31]

[1-38] [1-39]

Shows

- [1-38]: The number of RA DX indoor units connected to the system.
- [1-39]: The number of Hydrobox (HXY080/125) indoor units connected to the system.

[1-40] [1-41]

Shows:

- [1-40]: The current cooling comfort setting.
- [1-41]: The current heating comfort setting

6.1.8 Mode 2: Field settings

[2-0]

Cool/Heat selection setting.

[2-0]	Description
0 (default)	Each individual outdoor unit can select Cool/ Heat operation (by Cool/Heat selector if installed), or by defining master indoor user interface (see setting [2-83] and the operation manual).
1	Master unit decides Cool/Heat operation when outdoor units are connected in multiple system combination ^(a) .
2	Slave unit for Cool/Heat operation when outdoor units are connected in multiple system combination ^(a) .

(a) It is necessary to use the optional external control adaptor for outdoor unit (DTA104A61/62). See the instruction delivered with the adaptor for further details.

[2-8]

T_e target temperature during cooling operation.

[2-8]	T _e target (°C)
0 (default)	Auto
2	6
3	7
4	8
5	9
6	10
7	11

[2-9]

 $T_{\rm c}$ target temperature during heating operation.

[2-9]	T _c target (°C)
0 (default)	Auto
1	41
3	43
6	46

[2-14]

Input additional refrigerant amount that was charged.

In case you want to use the automatic leak detection functionality, it is required to input the total additional refrigerant charge amount.

[2-14]	Additional amount charged (kg)
0 (default)	No input
1	0 <x<5< td=""></x<5<>
2	5 <x<10< td=""></x<10<>
3	10 <x<15< td=""></x<15<>
4	15 <x<20< td=""></x<20<>
5	20 <x<25< td=""></x<25<>
6	25 <x<30< td=""></x<30<>
7	30 <x<35< td=""></x<35<>
8	35 <x<40< td=""></x<40<>
9	40 <x<45< td=""></x<45<>

[2-14]	Additional amount charged (kg)
10	45 <x<50< td=""></x<50<>
11	50 <x<55< td=""></x<55<>
12	55 <x<60< td=""></x<60<>
13	60 <x<65< td=""></x<65<>
14	65 <x<70< td=""></x<70<>
15	70 <x<75< td=""></x<75<>
16	75 <x<80< td=""></x<80<>
17	80 <x<85< td=""></x<85<>
18	85 <x<90< td=""></x<90<>
19	Setting cannot be used. Total refrigerant
20	charge has to be <100 kg.
21	

- For details concerning the calculation of additional refrigerant charge amount, see "5.6.3 To determine the additional refrigerant amount" on page 16.
- For guidance concerning the input of the additional refrigerant charge amount and leak detection function see "6.2 Using the leak detection function" on page 28.

[2-20]

Manual additional refrigerant charge.

[2-20]	Description
0 (default)	Deactivated.
1	Activated.
	To stop the manual additional refrigerant charge operation (when the required additional refrigerant amount is charged), push BS3. If this function was not aborted by pushing BS3, the unit will stop its operation after 30 minutes. If 30 minutes was not sufficient to add the needed refrigerant amount, the function can be reactivated by changing the field setting again.

[2-35]

Height difference setting.

[2-35]	Description
0	In case the outdoor unit is installed in the lowest position (indoor units are installed on a higher position than outdoor units) and the height difference between the highest indoor unit and the outdoor unit exceeds 40 m, the setting [2-35] should be changed to 0.
1 (default)	_

[2-49]

Height difference setting.

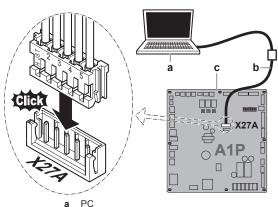

[2-49]	Description
0 (default)	_
1	In case the outdoor unit is installed in the highest position (indoor units are installed on a lower position than outdoor units) and the height difference between the lowest indoor unit and the outdoor unit exceeds 50 m, the setting [2-49] has to be changed to 1.

[2-83]

Master user interface allocation in case VRV DX indoor units and RA DX indoor units are used at the same time.

[2-83]	Description
0	VRV DX indoor unit has mode selection right.
1 (default)	RA DX indoor unit has mode selection right setting.

6.1.9 To connect the PC configurator to the outdoor unit

- **b** Cable (EKPCCAB)
- c Outdoor unit main PCB

6.2 Using the leak detection function

6.2.1 About automatic leak detection

The (automatic) leak detection function is not by default activated. The (automatic) leak detection function can only start working when both below conditions are fulfilled:

- The additional refrigerant charge was inputted in the system's logic (see [2-14]).
- The system test run was executed (see "7 Commissioning" on page 28), including the detailed refrigerant situation check.

The leak detection operation can be automated. By changing parameter [2-85] to chosen value, the interval time or the time till the next automatic leak detection operation can be chosen. The parameter [2-86] defines whether the leak detection operation is executed one time (within [2-85] days) or intermittent, respecting an interval of [2-85] days.

Availability of the leak detection function feature requires input of the additional refrigerant charge amount immediately after finishing the charging. The input must be executed before performing the test operation.

NOTICE

If a wrong value is input for the additional charged refrigerant weight, the accuracy of the leak detection function will decrease.

INFORMATION

- The weighed and already recorded amount of additional refrigerant charge (not the total amount of refrigerant present in the system) must be entered.
- The leak detection function is not available when Hydrobox units or RA DX indoor units are connected to the system.
- When the height difference between indoor units is ≥50/40 m, the leak detection function can not be used.

7 Commissioning

After installation and once the field settings are defined, the installer is obliged to verify correct operation. Therefore a test run must be performed according to the procedures described below.

7.1 Precautions when commissioning

CAUTION

Do not perform the test operation while working on the indoor units.

When performing the test operation, not only the outdoor unit, but the connected indoor unit will operate as well. Working on an indoor unit while performing a test operation is dangerous.

NOTICE

Be sure to turn on the power 6 hours before operation in order to have power running to the crankcase heater and to protect the compressor.

During test operation, the outdoor unit and the indoor units will start up. Make sure that the preparations of all indoor units are finished (field piping, electrical wiring, air purge, ...). See installation manual of the indoor units for details.

7.2 Checklist before test run

After the installation of the unit, first check the following items. Once all below checks are fulfilled, the unit must be closed, only then can the unit be powered up.

	Installation
	Check that the unit is properly installed, to avoid abnormal noises and vibrations when starting up the unit.
	Field wiring
	Be sure that the field wiring has been carried out according to the instructions described in the chapter "5.7 Connecting the electrical wiring" on page 22, according to the wiring diagrams and according to the applicable legislation.
	Power supply voltage
	Check the power supply voltage on the local supply panel. The voltage must correspond to the voltage on the identification label of the unit.
	Earth wiring
	Be sure that the earth wires have been connected properly and that the earth terminals are tightened.
	Insulation test of the main power circuit
	Using a megatester for 500 V, check that the insulation resistance of 2 M Ω or more is attained by applying a voltage of 500 V DC between power terminals and earth. Never use the megatester for the transmission wiring.
П	Fuses, circuit breakers, or protection devices
	Check that the fuses, circuit breakers, or the locally installed protection devices are of the size and type specified in the chapter "4.2.1 Safety device requirements" on page 9. Be sure that neither a fuse nor a protection device has been bypassed.
П	Internal wiring
	Visually check the electrical component box and the inside of the unit on loose connections or damaged electrical components.

Pipe size and pipe insulation
Be sure that correct pipe sizes are installed and that the insulation work is properly executed.
Stop valves
Be sure that the stop valves are open on both liquid and gas side.
Damaged equipment
Check the inside of the unit on damaged components or squeezed pipes.
Refrigerant leak
Check the inside of the unit on refrigerant leakage. If there is a refrigerant leak, try to repair the leak. If the repair is unsuccessful, call your local dealer. Do not touch any refrigerant which has leaked out from refrigerant piping connections. This may result in frostbite.
Oil leak
Check the compressor for oil leakage. If there is an oil leak, try to repair the leak. If the repairing is unsuccessful, call your local dealer.
Air inlet/outlet
Check that the air inlet and outlet of the unit is not obstructed by paper sheets, cardboard, or any other material.
Additional refrigerant charge
The amount of refrigerant to be added to the unit shall be written on the included "Added refrigerant" plate and attached to the rear side of the front cover.
Installation date and field setting
Be sure to keep record of the installation date on the sticker on the rear of the upper front panel according to EN60335-2-40 and keep record of the contents of the field setting(s).

7.3 About test run

The procedure below describes the test operation of the complete system. This operation checks and judges following items:

- Check of wrong wiring (communication check with indoor units).
- Check of the stop valves opening.
- Judgement of piping length.
- Gathering reference data for leak detection functionality. If the leak detection functionality is required, the test run needs to be executed including a detailed refrigerant situation check. If the leak detection functionality is NOT required, the test run can skip the detailed refrigerant situation check. This can be defined by setting [2-88].

INFORMATION

The refrigerant situation check cannot be performed beyond the following limits:

 Outdoor temperature: 0~43°C DB Indoor temperature: 20~32°C DB

Value [2-88]	Description
	The test run will be executed including the detailed refrigerant situation check. After the test run, the unit will be prepared for leak detection functionality (for more details, see "6.2 Using the leak detection function" on page 28).

Value [2-88]	Description
	The test run will be executed without the detailed refrigerant situation check. After the test run, the unit will NOT be prepared for leak detection functionality.

INFORMATION

- When [2-88]=0, the test operation time can take up to
- When [2-88]=0 and the test operation was aborted before the end, the $U\exists$ warning code will be visible on the user interface. It is possible to operate the system. Leak detection function will NOT be available. It is advised to re-execute the test operation.
- If the autocharge function was used, the unit informs the user in case unfavourable ambient conditions are present to gather detailed refrigerant situation data. When this is the case, the accuracy of leak detection operation will drop. It is advised in such a case to perform the test operation again on another more favourable moment. In case no "E-2" or "E-3" information was displayed during the autocharging procedure, it is possible to have reliable data gathering during the test operation. See ambient limitations in the information table on "5.6.6 Step 6a: To automatically charge refrigerant" on page 20.

In case Hydrobox units or RA DX indoor units are present in the system, the pipe length check and the refrigerant situation check will not be performed.

- · Make sure to carry out the system test operation after the first installation. Otherwise, the malfunction code $U\exists$ will be displayed on the user interface and normal operation or individual indoor unit test run cannot be carried out.
- Abnormalities on indoor units cannot be checked for each unit separately. After the test operation is finished, check the indoor units one by one by performing a normal operation using the user interface. Refer to the indoor unit installation manual for more details (e.g., Hydrobox) concerning the individual test run.

DAIKIN

INFORMATION

- It may take 10 minutes to achieve a uniform refrigerant state before the compressor starts.
- During the test operation, the refrigerant running sound or the magnetic sound of a solenoid valve may become loud and the display indication may change. These are not malfunctions.

7.4 To perform a test run

- 1 Close all front panels in order to not let it be the cause of misjudgement (except the electrical component box inspection opening service cover).
- 2 Make sure all field settings you want are set; see "6.1 Making field settings" on page 24.
- 3 Turn ON the power to the outdoor unit and the connected indoor units.

NOTICE

Be sure to turn on the power 6 hours before operation in order to have power running to the crankcase heater and to protect the compressor.

4 Make sure the default (idle) situation is existing; see "6.1.4 To access mode 1 or 2" on page 25. Push BS2 for 5 seconds or more. The unit will start test operation.

Result: The test operation is automatically carried out, the outdoor unit display will indicate "EB" and the indication "Test operation" and "Under centralised control" will display on the user interface of indoor units.

Steps during the automatic system test run procedure:

Step	Description
<i>E0 1</i>	Control before start up (pressure equalisation)
E02	Cooling start up control
E03	Cooling stable condition
EØ4	Communication check
£05	Stop valve check
£06	Pipe length check
E07	Refrigerant amount check
£08	In case [2-88]=0, detailed refrigerant situation check
E09	Pump down operation
E 10	Unit stop

Note: During the test operation, it is not possible to stop the unit operation from a user interface. To abort the operation, press BS3. The unit will stop after ± 30 seconds.

5 Check the test operation results on the outdoor unit 7-segment display.

Completion	Description
Normal completion	No indication on the 7-segment display (idle).
Abnormal completion	Indication of malfunction code on the 7-segment display.
	Refer to "7.5 Correcting after abnormal completion of the test run" on page 30 to take actions for correcting the abnormality. When the test operation is fully completed, normal operation will be possible after 5 minutes.

7.5 Correcting after abnormal completion of the test run

The test operation is only completed if there is no malfunction code displayed on the user interface or outdoor unit 7-segment display. In case of a displayed malfunction code, perform correcting actions as explained in the malfunction code table. Carry out the test operation again and confirm that the abnormality is properly corrected.

INFORMATION

Refer to the installation manual of the indoor unit for other detailed malfunction codes related to indoor units.

8 Troubleshooting

8.1 Solving problems based on error codes

In case of a displayed malfunction code, perform correcting actions as explained in the malfunction code table.

After correcting the abnormality, press BS3 to reset the malfunction code and retry operation.

The malfunction code which is displayed on the outdoor unit will indicate a main malfunction code and a sub code. The sub code indicates more detailed information about the malfunction code. The malfunction code will be displayed intermittent.

Example:

Code	Example
Main code	E 3
Sub code	- 🛛 🕴

With an interval of 1 second, the display will switch between main code and sub code

8.2 Error codes: Overview

Main code		Sub code		Cause	Solution
	Master	Slave 1	Slave 2

For the user

10 About the system

INFORMATION

This appliance is intended to be used by expert or trained users in shops, in light industry and on farms, or for commercial use by lay persons.

The indoor unit part of VRV IV heat pump system can be used for heating/cooling applications. The type of indoor unit which can be used depends on the outdoor units series.

NOTICE

Do not use the air conditioner for other purposes. In order to avoid any quality deterioration, do not use the unit for cooling precision instruments, food, plants, animals or works of art.

NOTICE

For future modifications or expansions of your system:

A full overview of allowable combinations (for future system extensions) is available in technical engineering data and should be consulted. Contact your installer to receive more information and professional advice.

10.1 System layout

Your VRV IV heat pump series outdoor unit can be one of following models:

Model	Description
RYYQ	Single continuous heating model.
RYMQ	Multi continuous heating model.
RXYQ	Single and multi non-continuous heating model.

Depending on the type of outdoor unit which is chosen, some functionality will or will not exist. It will be indicated throughout this operation manual when certain features have exclusive model rights or not.

11 User interface

CAUTION

Never touch the internal parts of the controller.

Do not remove the front panel. Some parts inside are dangerous to touch and appliance problems may happen. For checking and adjusting the internal parts, contact your dealer.

This operation manual will give a non-exhaustive overview of the main functions of the system.

Detailed information on required actions to achieve certain functions can be found in the dedicated installation and operation manual of the indoor unit.

Refer to the operation manual of the installed user interface.

12 Operation

12.1 Operating the system

12.1.1 About operating the system

- Operation procedure varies according to the combination of outdoor unit and user interface.
- To protect the unit, turn on the main power switch 6 hours before operation.
- If the main power supply is turned off during operation, operation will restart automatically after the power turns back on again.

12.1.2 About cooling, heating, fan only, and automatic operation

- Changeover cannot be made with a user interface whose display shows change-over under centralised control" (refer to installation and operation manual of the user interface).
- When the display Shape-over under centralised control flashes, refer to "12.4.1 About setting the master user interface" on page 38.
- The fan may keep on running for about 1 minute after the heating operation stops.
- The air flow rate may adjust itself depending on the room temperature or the fan may stop immediately. This is not a malfunction.

12.1.3 About the heating operation

It may take longer to reach the set temperature for general heating operation than for cooling operation.

The following operation is performed in order to prevent the heating capacity from dropping or cold air from blowing.

Defrost operation

In heating operation, freezing of the outdoor unit's air cooled coil increases over time, restricting the energy transfer to the outdoor unit's coil. Heating capability decreases and the system needs to go into defrost operation to be able to deliver enough heat to the indoor units:

If	Then
RYYQ or RYMQ outdoor unit is installed	The indoor unit will continue heating operation at a reduced level during defrost operation. It will guarantee a decent comfort level indoor. A heat storage element in the outdoor unit will provide the energy to deice the outdoor unit's air cooled coil during defrost operation.
RXYQ outdoor unit is installed	The indoor unit will stop fan operation, the refrigerant cycle will reverse and energy from inside the building will be used to defrost the outdoor unit coil.

The indoor unit will indicate defrost operation on the displays $\begin{picture}(60,0) \put(0,0){\line(0,0){120}} \put(0,0){$

Hot start

In order to prevent cold air from blowing out of an indoor unit at the start of heating operation, the indoor fan is automatically stopped. The display of the user interface shows (). It may take some time before the fan starts. This is not a malfunction.

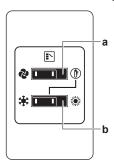

12.1.4 To operate the system (WITHOUT cool/ heat changeover remote control switch)

- 1 Press the operation mode selector button on the user interface several times and select the operation mode of your choice.
 - * Cooling operation
 - Heating operation
 - Fan only operation
- 2 Press the ON/OFF button on the user interface.

Result: The operation lamp lights up and the system starts operating.

12.1.5 To operate the system (WITH cool/heat changeover remote control switch)

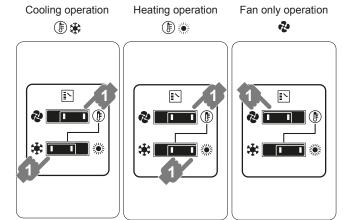

Overview of the changeover remote control switch

- a FAN ONLY/AIR CONDITIONING SELECTOR SWITCH
 - Set the switch to for fan only operation or to for heating or cooling operation.
- b COOL/HEAT CHANGEOVER SWITCH Set the switch to ♣ for cooling or to ♠ for heating

To start

1 Select operation mode with the cool/heat changeover switch as follows:

2 Press the ON/OFF button on the user interface.

Result: The operation lamp lights up and the system starts operating.

To stop

3 Press the ON/OFF button on the user interface once again.

Result: The operation lamp goes out and the system stops operating.

NOTICE

Do not turn off power immediately after the unit stops, but wait for at least 5 minutes.

To adjust

For programming temperature, fan speed and air flow direction refer to the operation manual of the user interface.

12.2 Using the dry program

12.2.1 About the dry program

- The function of this program is to decrease the humidity in your room with minimal temperature decrease (minimal room cooling).
- The micro computer automatically determines temperature and fan speed (cannot be set by the user interface).
- The system does not go into operation if the room temperature is low (<20°C).

12.2.2 To use the dry program (WITHOUT cool/ heat changeover remote control switch)

To start

- 1 Press the operation mode selector button on the user interface several times and select (program dry operation).
- 2 Press the ON/OFF button of the user interface.
 - **Result:** The operation lamp lights up and the system starts operating.
- 3 Press the air flow direction adjust button (only for double-flow, multi-flow, corner, ceiling-suspended and wall-mounted). Refer to "12.3 Adjusting the air flow direction" on page 38 for details.

To stop

4 Press the ON/OFF button on the user interface once again.

Result: The operation lamp goes out and the system stops operating.

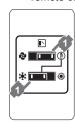

NOTICE

Do not turn off power immediately after the unit stops, but wait for at least 5 minutes.

12.2.3 To use the dry program (WITH cool/heat changeover remote control switch)

To start

 Select cooling operation mode with the cool/heat changeover remote control switch.

- 2 Press the operation mode selector button on the user interface several times and select () (program dry operation).
- 3 Press the ON/OFF button of the user interface.
 - **Result:** The operation lamp lights up and the system starts operating.
- 4 Press the air flow direction adjust button (only for double-flow, multi-flow, corner, ceiling-suspended and wall-mounted). Refer to "12.3 Adjusting the air flow direction" on page 38 for details.

To stop

5 Press the ON/OFF button on the user interface once again.

Result: The operation lamp goes out and the system stops operating.

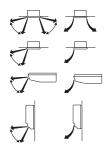

NOTICE

Do not turn off power immediately after the unit stops, but wait for at least 5 minutes.

12.3 Adjusting the air flow direction

Refer to the operation manual of the user interface.

12.3.1 About the air flow flap

Double flow+multi-flow units

Corner units

Ceiling suspended units

Wall-mounted units

For the following conditions, a micro computer controls the air flow direction which may be different from the display.

Cooling	Heating
When the room temperature is lower than the set temperature.	• .
14.0	

- · When operating continuously at horizontal air flow direction.
- When continuous operation with downward air flow is performed at the time of cooling with a ceiling-suspended or a wall-mounted unit, the micro computer may control the flow direction, and then the user interface indication will also change.

The air flow direction can be adjusted in one of the following ways:

- The air flow flap itself adjusts its position.
- The air flow direction can be fixed by the user.
- Automatic and desired position J.

WARNING

Never touch the air outlet or the horizontal blades while the swing flap is in operation. Fingers may become caught or the unit may break down.

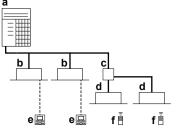

NOTICE

- The movable limit of the flap is changeable. Contact your dealer for details. (only for double-flow, multi-flow, corner, ceiling-suspended and wall-mounted).
- Avoid operating in the horizontal direction - □. It may cause dew or dust to settle on the ceiling or flap.

12.4 Setting the master user interface

12.4.1 About setting the master user interface

- a VRV heat pump outdoor unit
- **b** VRV direct expansion (DX) indoor unit
- c BP box (required to connect Residential Air (RA) or Sky Air (SA) Direct Expansion (DX) indoor units)
- **d** Residential Air (RA) Direct Expansion (DX) indoor units)
- e User interface (dedicated depending on indoor unit type)
- f User interface (wireless, dedicated depending on indoor unit type)

When the system is installed as shown in the figure above, it is necessary to designate one of the user interfaces as the master user interface.

The displays of slave user interfaces show \(\bigcap \) (change-over under centralised control) and slave user interfaces automatically follow the operation mode directed by the master user interface.

Only the master user interface can select heating or cooling mode.

13 Maintenance and service

NOTICE

Never inspect or service the unit by yourself. Ask a qualified service person to perform this work.

WARNING

Never replace a fuse with a fuse of a wrong ampere ratings or other wires when a fuse blows out. Use of wire or copper wire may cause the unit to break down or cause a fire.

CAUTION

Do not insert fingers, rods or other objects into the air inlet or outlet. Do not remove the fan guard. When the fan is rotating at high speed, it will cause injury.

CAUTION

After a long use, check the unit stand and fitting for damage. If damaged, the unit may fall and result in injury.

NOTICE

Do not wipe the controller operation panel with benzine, thinner, chemical dust cloth, etc. The panel may get discoloured or the coating peeled off. If it is heavily dirty, soak a cloth in water-diluted neutral detergent, squeeze it well and wipe the panel clean. Wipe it with another dry cloth.

13.1 After-sales service and warranty

13.1.1 Warranty period

- This product includes a warranty card that was filled in by the dealer at the time of installation. The completed card has to be checked by the customer and stored carefully.
- If repairs to the air conditioner are necessary within the warranty period, contact your dealer and keep the warranty card at hand.

13.1.2 Recommended maintenance and inspection

Since dust collects when using the unit for several years, performance of the unit will deteriorate to some extent. As taking apart and cleaning interiors of units requires technical expertise and in order to ensure the best possible maintenance of your units, we recommend to enter into a maintenance and inspection contract on top of normal maintenance activities. Our network of dealers has access to a permanent stock of essential components in order to keep your air conditioner in operation as long as possible. Contact your dealer for more information.

When asking your dealer for an intervention, always state:

- The complete model name of the air conditioner.
- The manufacturing number (stated on the nameplate of the unit).
- · The installation date.
- The symptoms or malfunction, and details of the defect.

WARNING

- Do not modify, disassemble, remove, reinstall or repair the unit yourself as incorrect dismantling or installation may cause an electric shock or fire. Contact your dealer.
- In case of accidental refrigerant leaks, make sure there are no naked flames. The refrigerant itself is entirely safe, non-toxic and non-combustible, but it will generate toxic gas when it accidentally leaks into a room where combustible air from fan heaters, gas cookers, etc. is present. Always have qualified service personnel confirm that the point of leakage has been repaired or corrected before resuming operation.

14 Troubleshooting

If one of the following malfunctions occur, take the measures shown below and contact your dealer.

WARNING

Stop operation and shut off the power if anything unusual occurs (burning smells etc.).

Leaving the unit running under such circumstances may cause breakage, electric shock or fire. Contact your dealer.

The system must be repaired by a qualified service person:

Malfunction	Measure
If a safety device such as a fuse, a breaker or an earth leakage breaker frequently actuates or the ON/OFF switch does not properly work.	Turn off the main power switch.
If water leaks from the unit.	Stop the operation.
The operation switch does not work well.	Turn off the power.
If the user interface display indicates the unit number, the operation lamp flashes and the malfunction code appears.	Notify your installer and report the malfunction code.

If the system does not properly operate except for the above mentioned cases and none of the above mentioned malfunctions is evident, investigate the system according to the following procedures.

Malfunction	Measure
If the system does not operate at all.	 Check if there is no power failure. Wait until power is restored. If power failure occurs during operation, the system automatically restarts immediately after the power supply is recovered.
	 Check if no fuse has blown or breaker has worked. Change the fuse or reset the breaker if necessary.
If the system goes into fan only operation, but as soon as it goes into heating or cooling operation, the system stops.	 Check if air inlet or outlet of outdoor or indoor unit is not blocked by obstacles. Remove any obstacle and make it well- ventilated.
	Check if the user interface display shows (time to clean the air filter). (Refer to "13 Maintenance and service" on page 38 and "Maintenance" in the indoor unit manual.)

14 Troubleshooting

Malfunction	Measure
The system operates but cooling or heating is insufficient.	 Check if air inlet or outlet of outdoor or indoor unit is not blocked by obstacles.
	 Remove any obstacle and make it well- ventilated.
	 Check if the air filter is not clogged (refer to "Maintenance" in the indoor unit manual).
	Check the temperature setting.
	 Check the fan speed setting on your user interface.
	 Check for open doors or windows. Shut doors and windows to prevent wind from coming in.
	 Check if there are too many occupants in the room during cooling operation. Check if the heat source of the room is excessive.
	 Check if direct sunlight enters the room. Use curtains or blinds.
	Check if the air flow angle is proper.

If after checking all above items, it is impossible to fix the problem yourself, contact your installer and state the symptoms, the complete model name of the air conditioner (with manufacturing number if possible) and the installation date (possibly listed on the warranty card).

14.1 Error codes: Overview

In case a malfunction code appears on the indoor unit user interface display, contact your installer and inform the malfunction code, the unit type, and serial number (you can find this information on the nameplate of the unit).

For your reference, a list with malfunction codes is provided. You can, depending on the level of the malfunction code, reset the code by pushing the ON/OFF button. If not, ask your installer for advice.

Main code	Contents
RD	External protection device was activated
R I	EEPROM failure (indoor)

	Auto address malfunction (inconsistency)
UН	Auto address malfunction (inconsistency)

14.2 Symptoms that are not air conditioner troubles

Following symptoms are not air conditioner troubles:

14.2.1 Symptom: The system does not operate

- The air conditioner does not start immediately after the ON/OFF button on the user interface is pressed. If the operation lamp lights, the system is in normal condition. To prevent overloading of the compressor motor, the air conditioner starts 5 minutes after it is turned ON again in case it was turned OFF just before. The same starting delay occurs after the operation mode selector button was used.
- If "Under Centralized Control" is displayed on the user interface, pressing the operation button causes the display to blink for a few seconds. The blinking display indicates that the user interface cannot be used.
- The system does not start immediately after the power supply is turned on. Wait one minute until the micro computer is prepared for operation.

14.2.2 Symptom: Cool/Heat cannot be changed over

- When the display shows (change-over under centralized control), it shows that this is a slave user interface.
- When the cool/heat changeover remote control switch is installed and the display shows (change-over under centralized control), this is because cool/heat changeover is controlled by the cool/ heat changeover remote control switch. Ask your dealer where the remote control switch is installed.

14.2.3 Symptom: Fan operation is possible, but cooling and heating do not work

Immediately after the power is turned on. The micro computer is getting ready to operate and is performing a communication check with all indoor units. Please wait 12 minutes (max.) till this process is finished.

14.2.4 Symptom: The fan strength does not correspond to the setting

The fan speed does not change even if the fan speed adjustment button in pressed. During heating operation, when the room temperature reaches the set temperature, the outdoor unit goes off and the indoor unit changes to whisper fan speed. This is to prevent cold air blowing directly on occupants of the room. The fan speed will not change even when another indoor unit is in heating operation, if the button is pressed.

14.2.5 Symptom: The fan direction does not correspond to the setting

The fan direction does not correspond with the user interface display. The fan direction does not swing. This is because the unit is being controlled by the micro computer.

14.2.6 Symptom: White mist comes out of a unit (Indoor unit)

- When humidity is high during cooling operation. If the interior of an
 indoor unit is extremely contaminated, the temperature distribution
 inside a room becomes uneven. It is necessary to clean the
 interior of the indoor unit. Ask your dealer for details on cleaning
 the unit. This operation requires a qualified service person.
- Immediately after the cooling operation stops and if the room temperature and humidity are low. This is because warm refrigerant gas flows back into the indoor unit and generates steam.

14.2.7 Symptom: White mist comes out of a unit (Indoor unit, outdoor unit)

When the system is changed over to heating operation after defrost operation. Moisture generated by defrost becomes steam and is exhausted.

14.2.8 Symptom: The user interface display reads "U4" or "U5" and stops, but then restarts after a few minutes

This is because the user interface is intercepting noise from electric appliances other than the air conditioner. The noise prevents communication between the units, causing them to stop. Operation automatically restarts when the noise ceases.

14.2.9 Symptom: Noise of air conditioners (Indoor unit)

- A "zeen" sound is heard immediately after the power supply is turned on. The electronic expansion valve inside an indoor unit starts working and makes the noise. Its volume will reduce in about one minute.
- A continuous low "shah" sound is heard when the system is in cooling operation or at a stop. When the drain pump (optional accessories) is in operation, this noise is heard.
- A "pishi-pishi" squeaking sound is heard when the system stops after heating operation. Expansion and contraction of plastic parts caused by temperature change make this noise.
- A low "sah", "choro-choro" sound is heard while the indoor unit is stopped. When another indoor unit is in operation, this noise is heard. In order to prevent oil and refrigerant from remaining in the system, a small amount of refrigerant is kept flowing.

14.2.10 Symptom: Noise of air conditioners (Indoor unit, outdoor unit)

- A continuous low hissing sound is heard when the system is in cooling or defrost operation. This is the sound of refrigerant gas flowing through both indoor and outdoor units.
- A hissing sound which is heard at the start or immediately after stopping operation or defrost operation. This is the noise of refrigerant caused by flow stop or flow change.

14.2.11 Symptom: Noise of air conditioners (Outdoor unit)

When the tone of operating noise changes. This noise is caused by the change of frequency.

14.2.12 Symptom: Dust comes out of the unit

When the unit is used for the first time in a long time. This is because dust has gotten into the unit.

14.2.13 Symptom: The units can give off odours

The unit can absorb the smell of rooms, furniture, cigarettes, etc., and then emit it again.

14.2.14 Symptom: The outdoor unit fan does not spin

During operation. The speed of the fan is controlled in order to optimise product operation.

14.2.15 Symptom: The display shows "88"

This is the case immediately after the main power supply switch is turned on and means that the user interface is in normal condition. This continues for one minute.

14.2.16 Symptom: The compressor in the outdoor unit does not stop after a short heating operation

This is to prevent refrigerant from remaining in the compressor. The unit will stop after 5 to 10 minutes.

14.2.17 Symptom: The inside of an outdoor unit is warm even when the unit has stopped

This is because the crankcase heater is warming the compressor so that the compressor can start smoothly.

14.2.18 Symptom: Hot air can be felt when the indoor unit is stopped

Several different indoor units are being run on the same system. When another unit is running, some refrigerant will still flow through the unit.

15 Relocation

Contact your dealer for removing and reinstalling the total unit. Moving units requires technical expertise.

16 Disposal

This unit uses hydrofluorocarbon. Contact your dealer when discarding this unit. It is required by law to collect, transport and discard the refrigerant in accordance with the "hydrofluorocarbon collection and destruction" regulations.
